

# Facing Moore's Law with Model-Driven R&D

Markus Matthes

Executive Vice President Development and Engineering, ASML

Eindhoven, June 11<sup>th</sup>, 2015

# Contents

- Introducing ASML
- Lithography, the driving force behind Moore's Law
- How to continue driving Moore's law?
- Summary and conclusions

# Introducing ASML

# It's hard to imagine a world without chips

Global market 2014: 221 billion chips, \$333 billion

# ASML makes the machines for making those chips

**ASML**

Public  
Slide 5  
June 2015

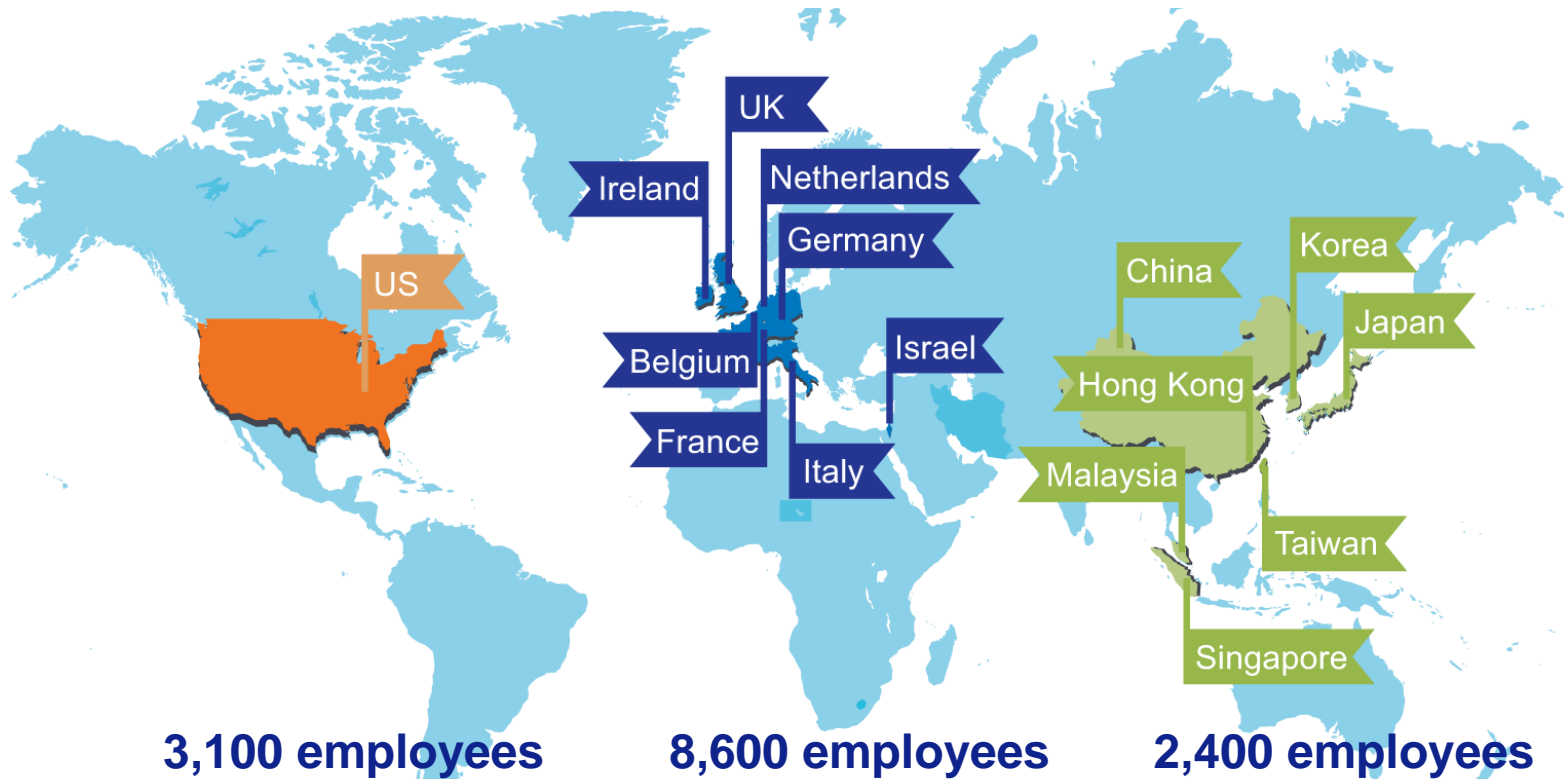

- Lithography is the critical tool for producing chips
- All of the world's top chip makers are our customers
- 2014 sales: €5.9 bln
- People: ~14,000 FTEs

# Founded in 1984 as a spin-off from Philips...

...with global presence!

Over 70 sales and service offices located worldwide

The background of the slide features a series of light blue, wavy lines that flow from the left side towards the right, creating a sense of movement and depth. The lines are thin and closely spaced, with a slight gradient in color from light to a slightly darker blue.

# Moore's law

# Driving the semiconductor industry: Moore's Law

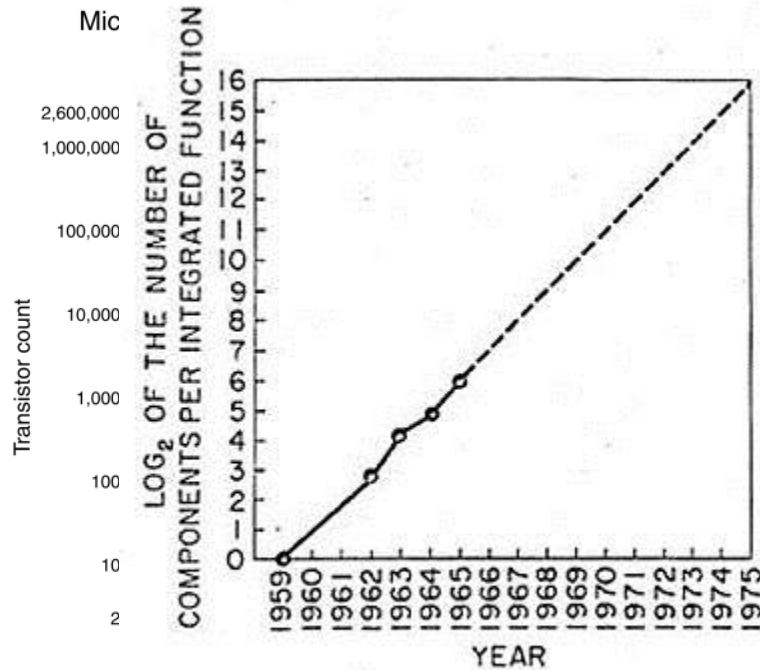

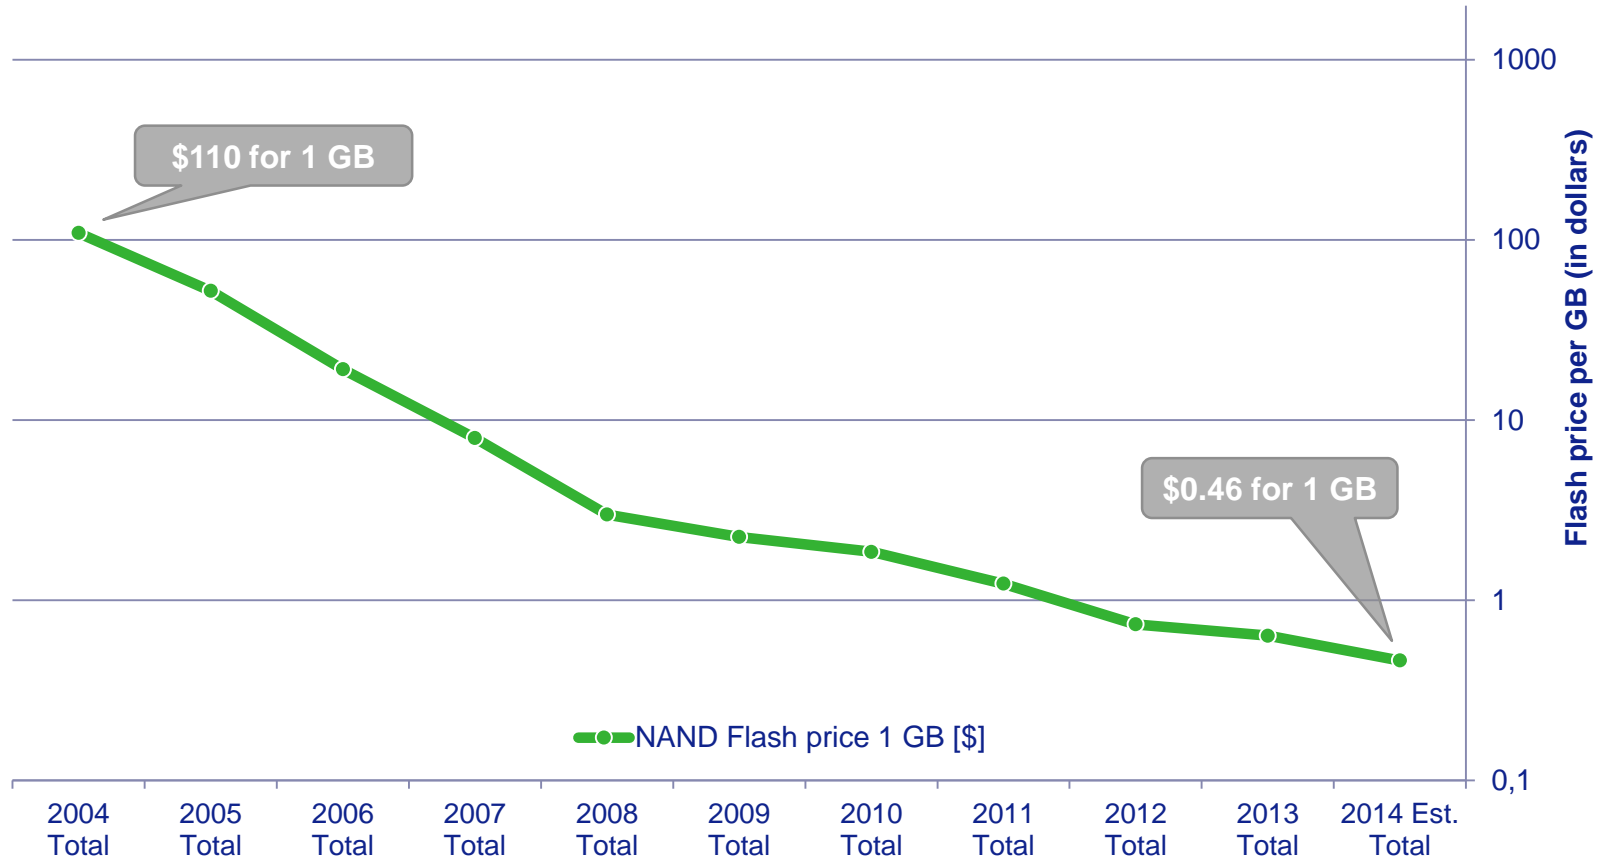

Fig. 2 Number of components per integrated function for minimum cost per component extrapolated vs time.

Gordon Moore (1965):  
Number of transistors per  
chip doubles every year.

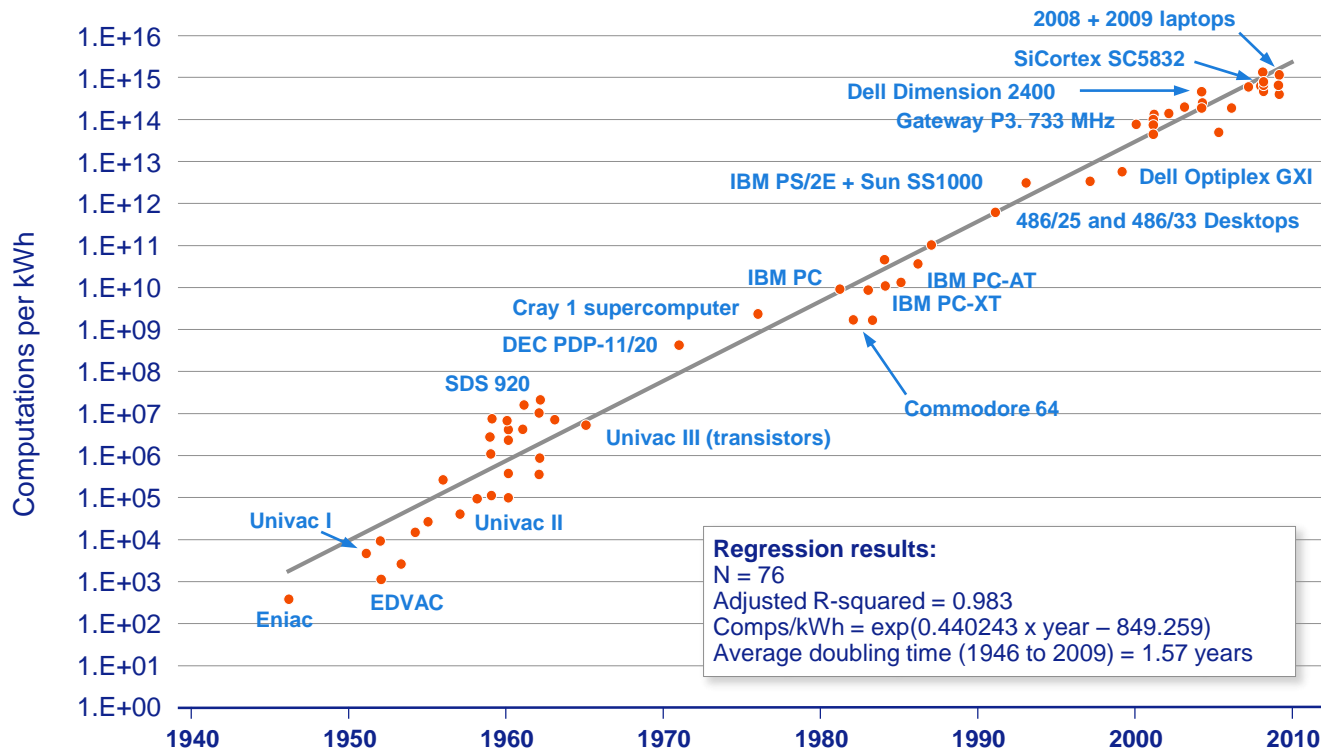

Later adjusted to two years,  
the trend has held for half a  
century

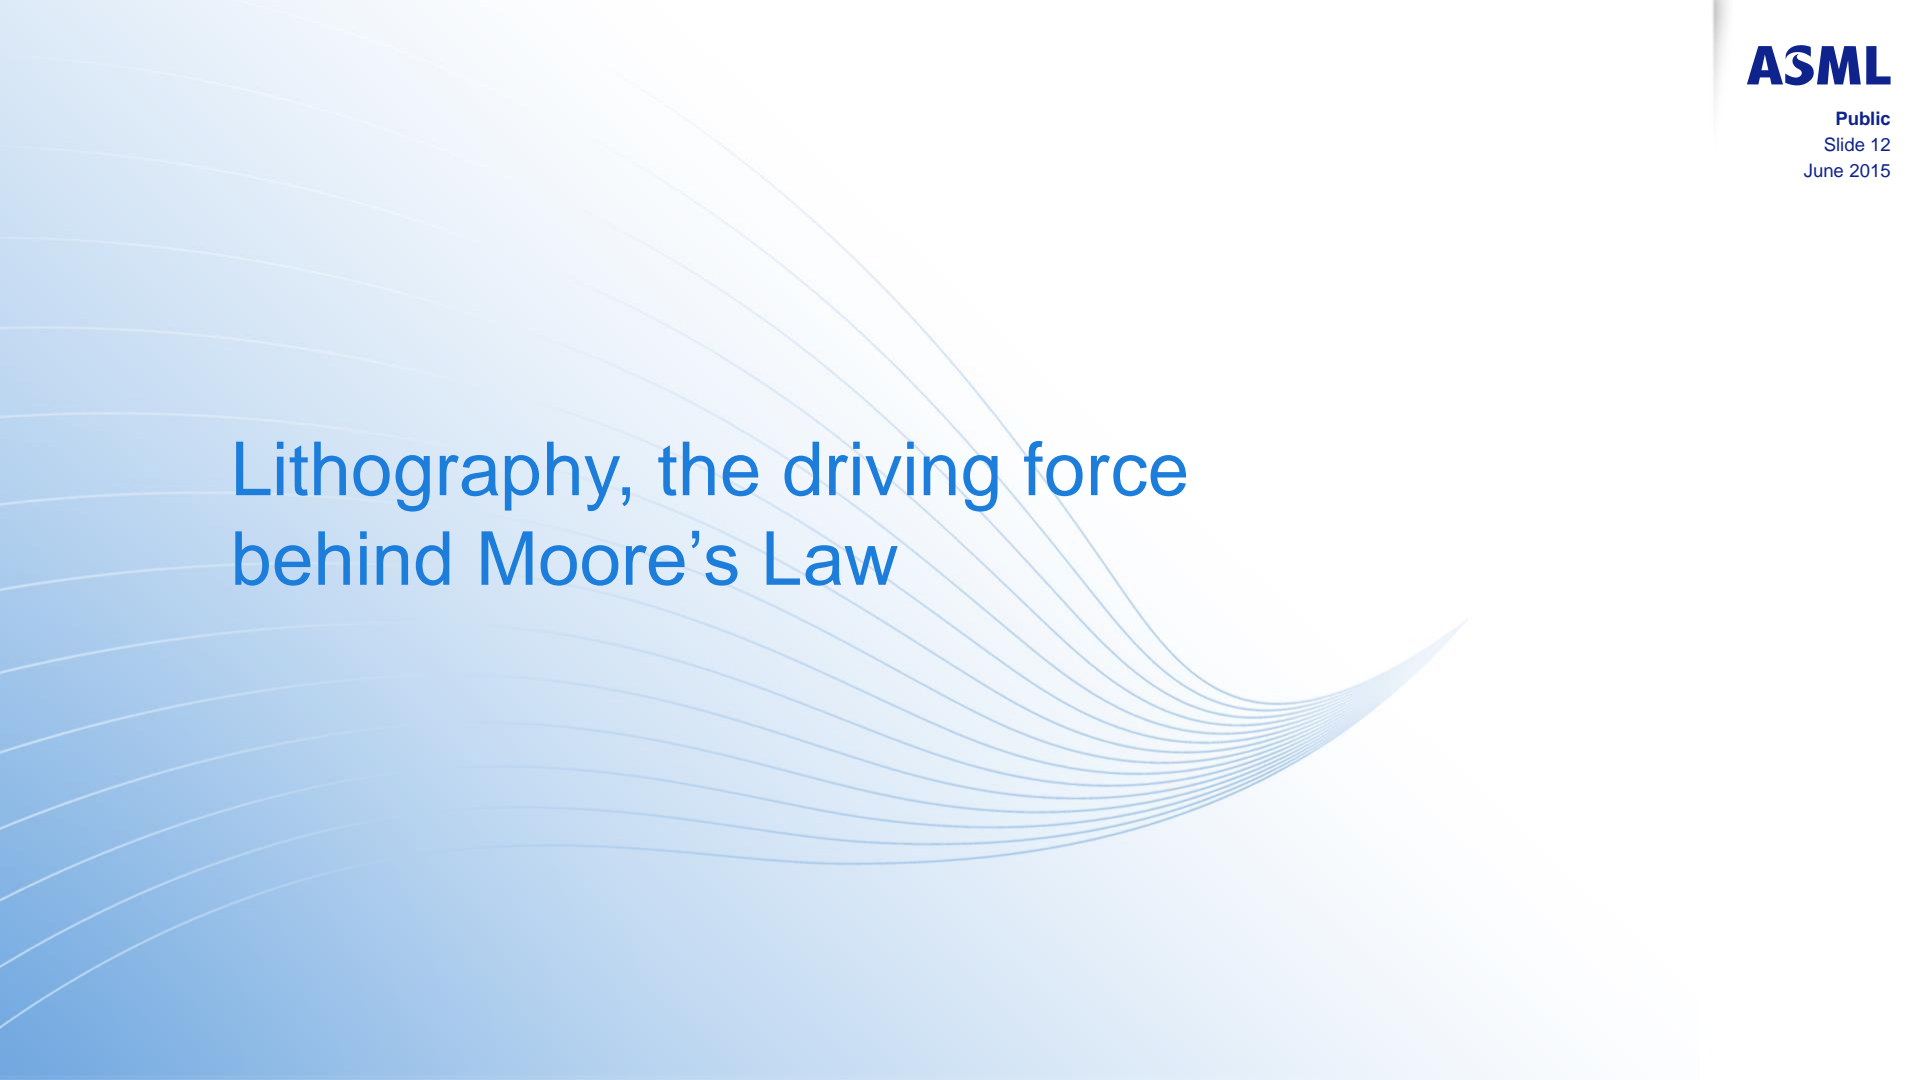

# Moore's Law makes chips cheaper...

# ... and more energy-efficient

## Computations per Kilowatt hour double every 1.5 years

The background of the slide features a series of light blue, wavy lines that curve from the bottom left towards the right, creating a sense of motion and depth. The lines are thin and spaced out, with a gradient that fades from a slightly darker blue on the left to a lighter blue on the right.

# Lithography, the driving force behind Moore's Law

A chip is made of dozens of layers

# The manufacturing loop

# Lithography is critical for shrinking transistors

Like a photo enlarger of old, lithography forms the image of chip patterns on a wafer

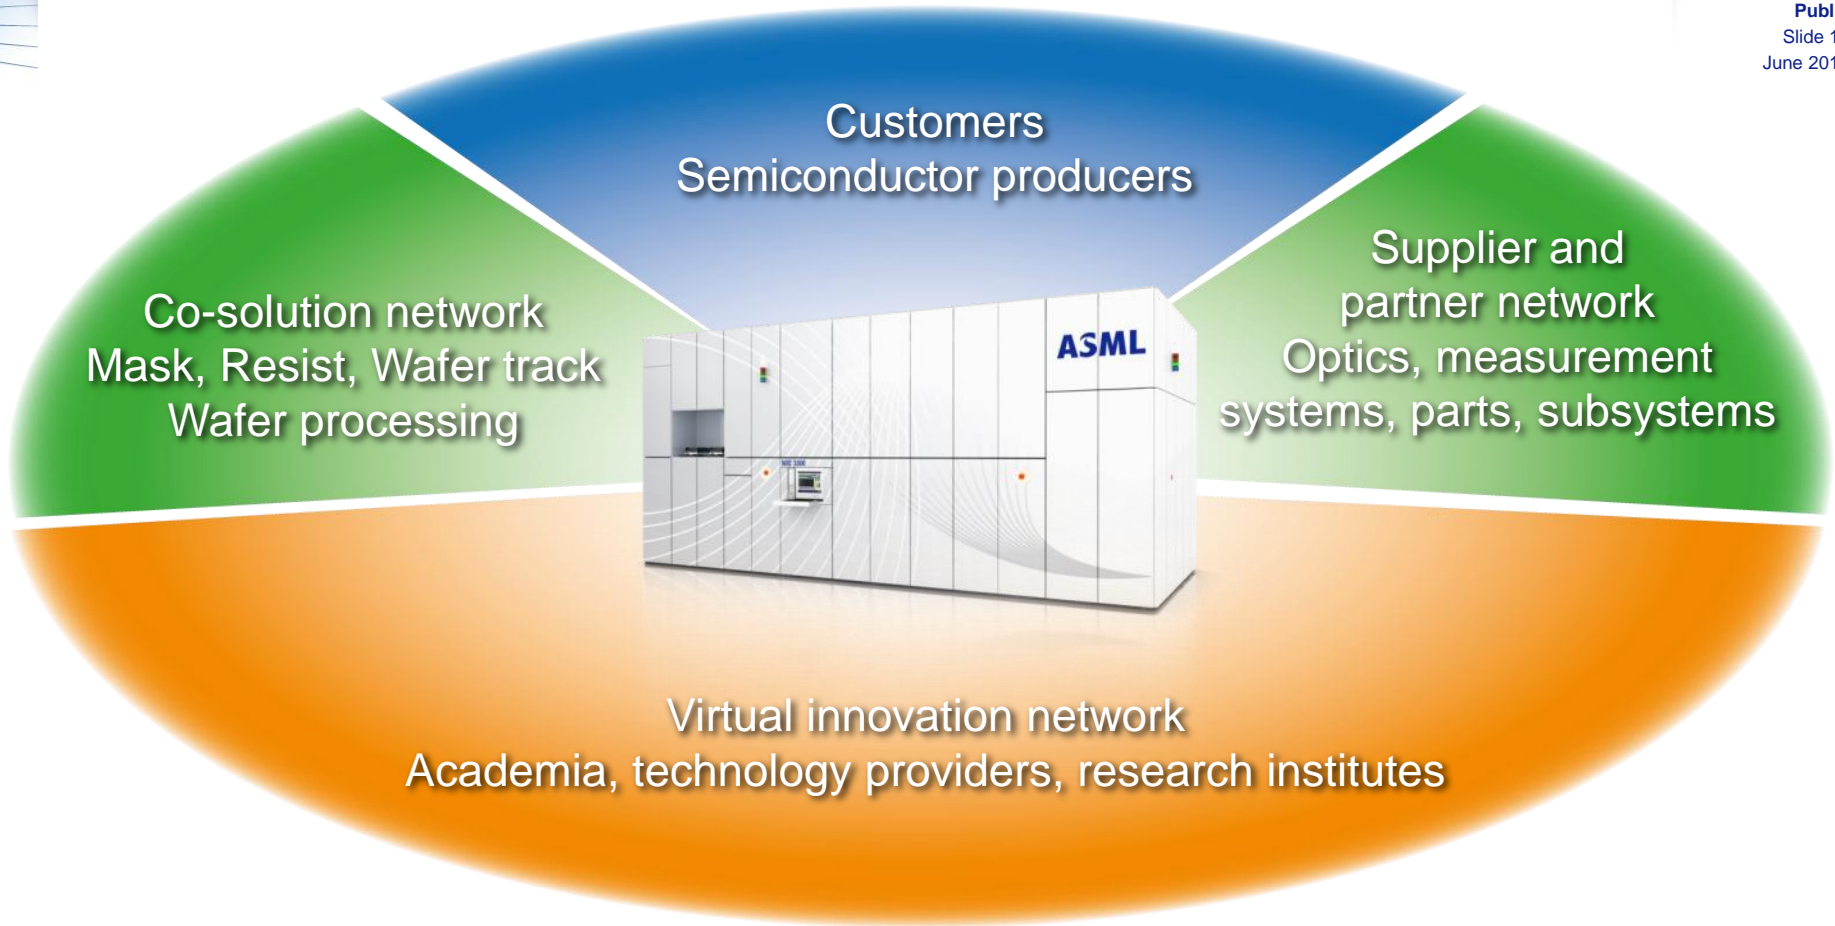

The background of the slide features a series of light blue, wavy lines that flow from the left side towards the right, creating a sense of movement and depth. The lines are thin and closely spaced, fading out as they move towards the right edge of the slide.

The ASML ecosystem makes this happen

# Open Innovation from design to manufacturing

# Open Innovation from design to manufacturing

The background of the slide features a series of light blue, wavy lines that flow from the left side towards the right, creating a sense of movement and depth. The lines are thin and closely spaced, fading out as they move towards the right edge of the slide.

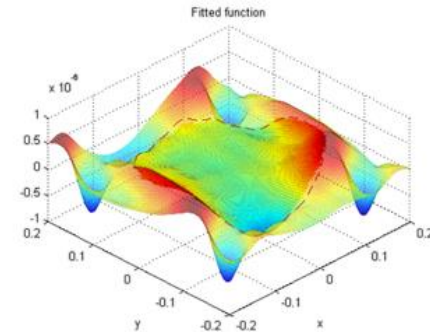

# Increasing complexity, increasing challenges

# Scanner functionality and hardware become increasingly more complex

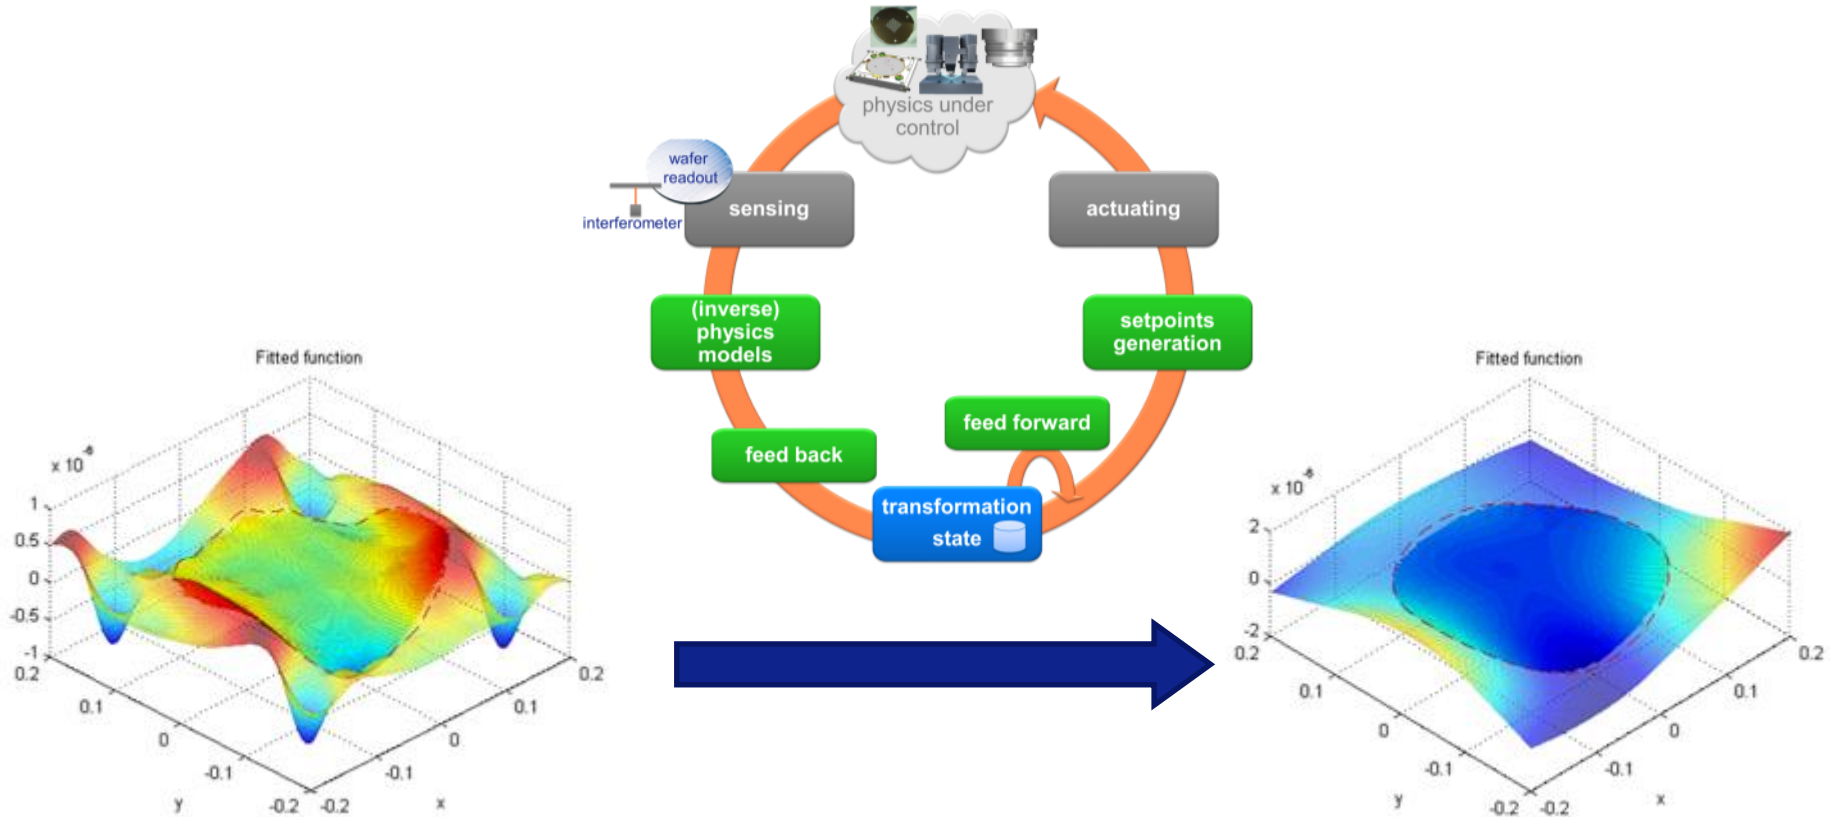

The world is far from perfect at (sub-)nanometer level

- Flat is no longer flat, straight is no longer straight
- Variations due to flow, temperature and humidity variations
- Sensitivity to dynamics, magnetics, and pressure differences

# Physics, mathematics and software correct hardware imperfections at (sub-)nanometer level

## Example: Lens Model

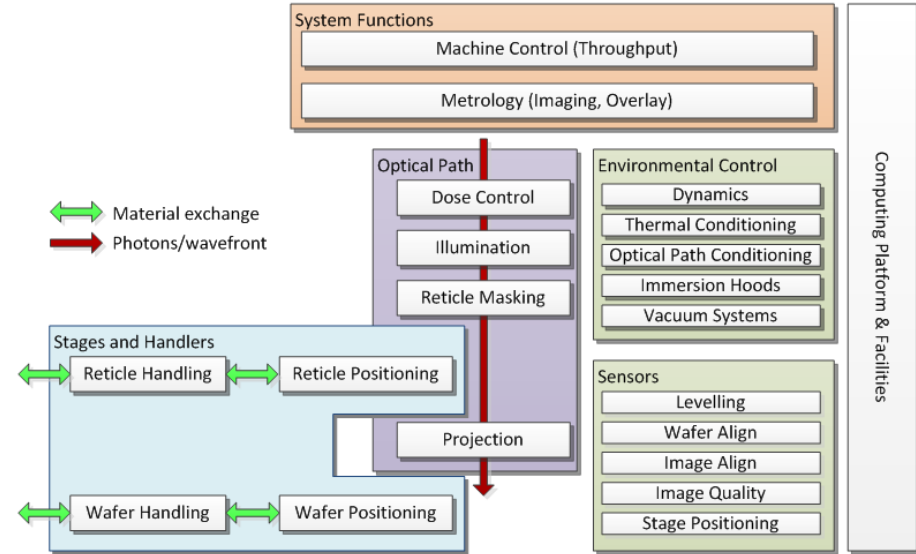

- Laser beam heats up lens
  - A sensor measures the lens aberrations
  - The lens model calculates how to adjust the lens (within 12 ms)
  - Lens is adjusted and wafer is exposed in optimum state
- 
- Lens model implemented in MATLAB
  - Timing constraints met by code optimization together with MathWorks: 39% speed gain

Function	Original MATLAB Code	Best solution in MATLAB	Speedup Gain
qpGTikh	1.331 s	0.613 s	54 %
<u>analytic_center</u>	3.206 s	2.549 s	21 %
<b>Total</b>	<b>4.403 s</b>	<b>2.693 s</b>	<b>39 %</b>

# ASML software development reflects increasing complexity

- TWINSCAN software consists of 40 million lines of code
- More than 500,000 lines of MATLAB code in TwinScan archive
- 20+ computing nodes running more than 200 processes
- Our software supports old as well as new systems
  - SW archive embeds > 10 years of development history, thousands of man years of work

# How to continue driving Moore's law?

# The other side of Moore's medal...

Development & engineering costs rapidly growing

**1980s:**

**PAS 2000/5000**

R&D: 50 mln €

**1990s:**

**PAS 5500**

R&D: 400 mln €

**2000s:**

**TWINSCAN**

R&D: 1500 mln €

**2010s:**

**NXE EUV**

R&D: > 2000 mln €

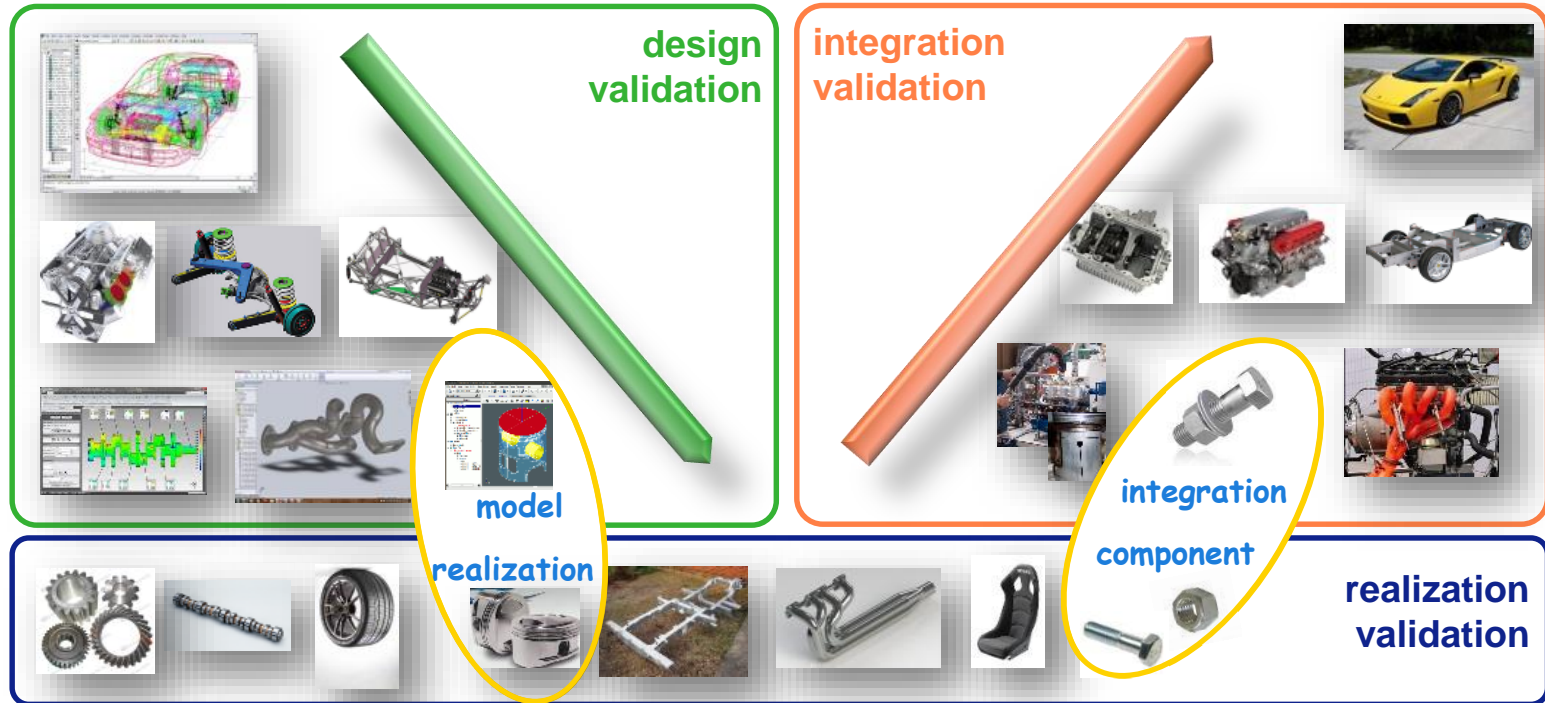

How to continue driving Moore's law and ensure customer profitability,  
while keeping R&D cost under control?

# Investing in early development phase leads to gain in product maturing phase and earlier customer profitability

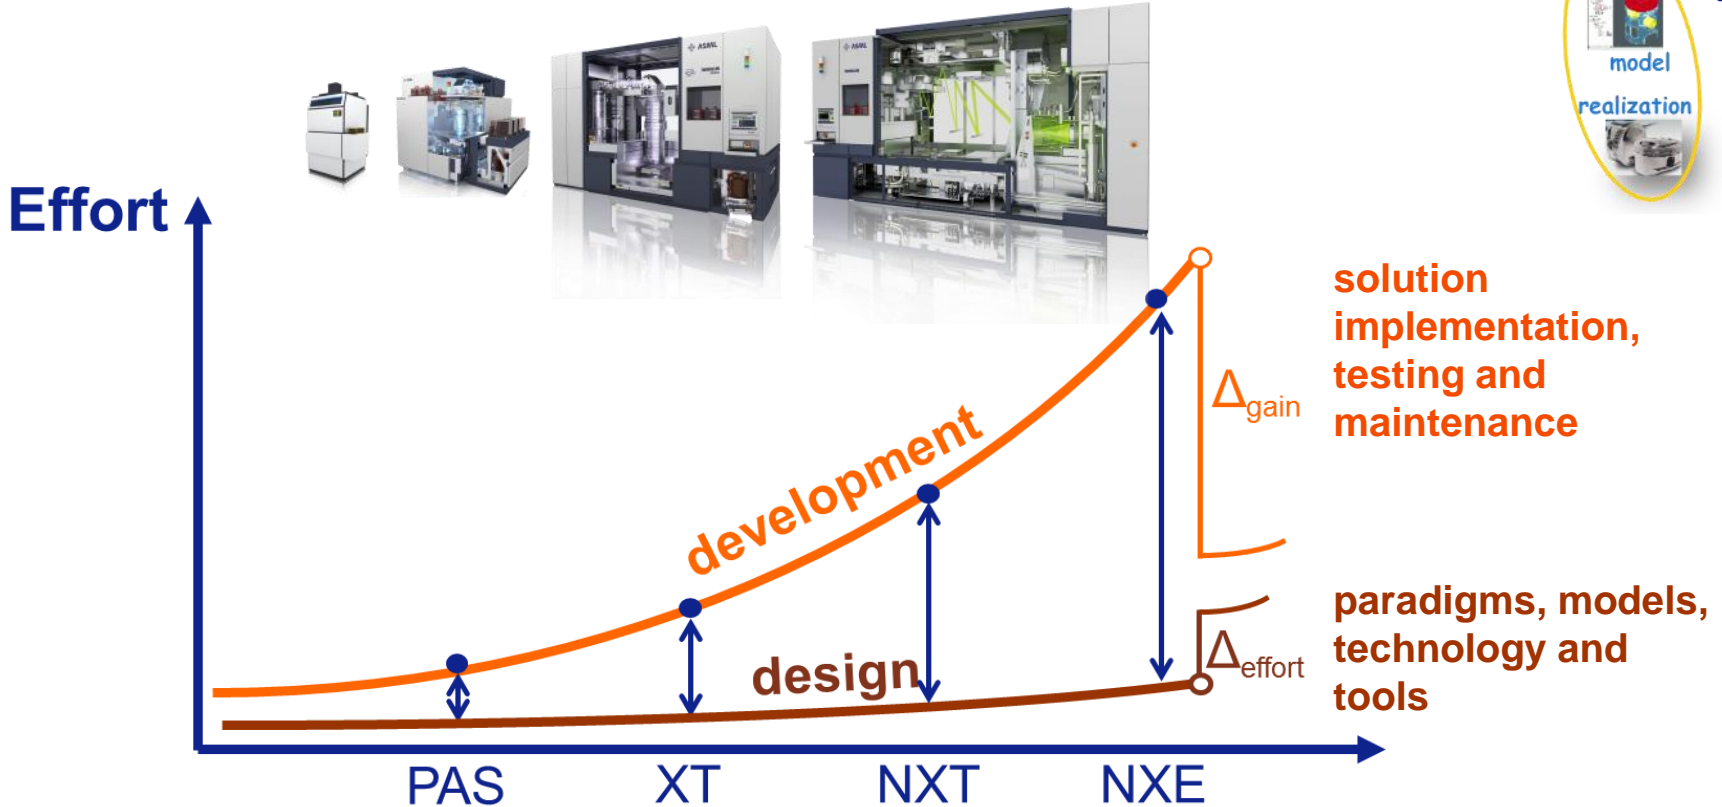

# But how to invest more in the early development phase?

Let us look at a Development and Engineering work flow

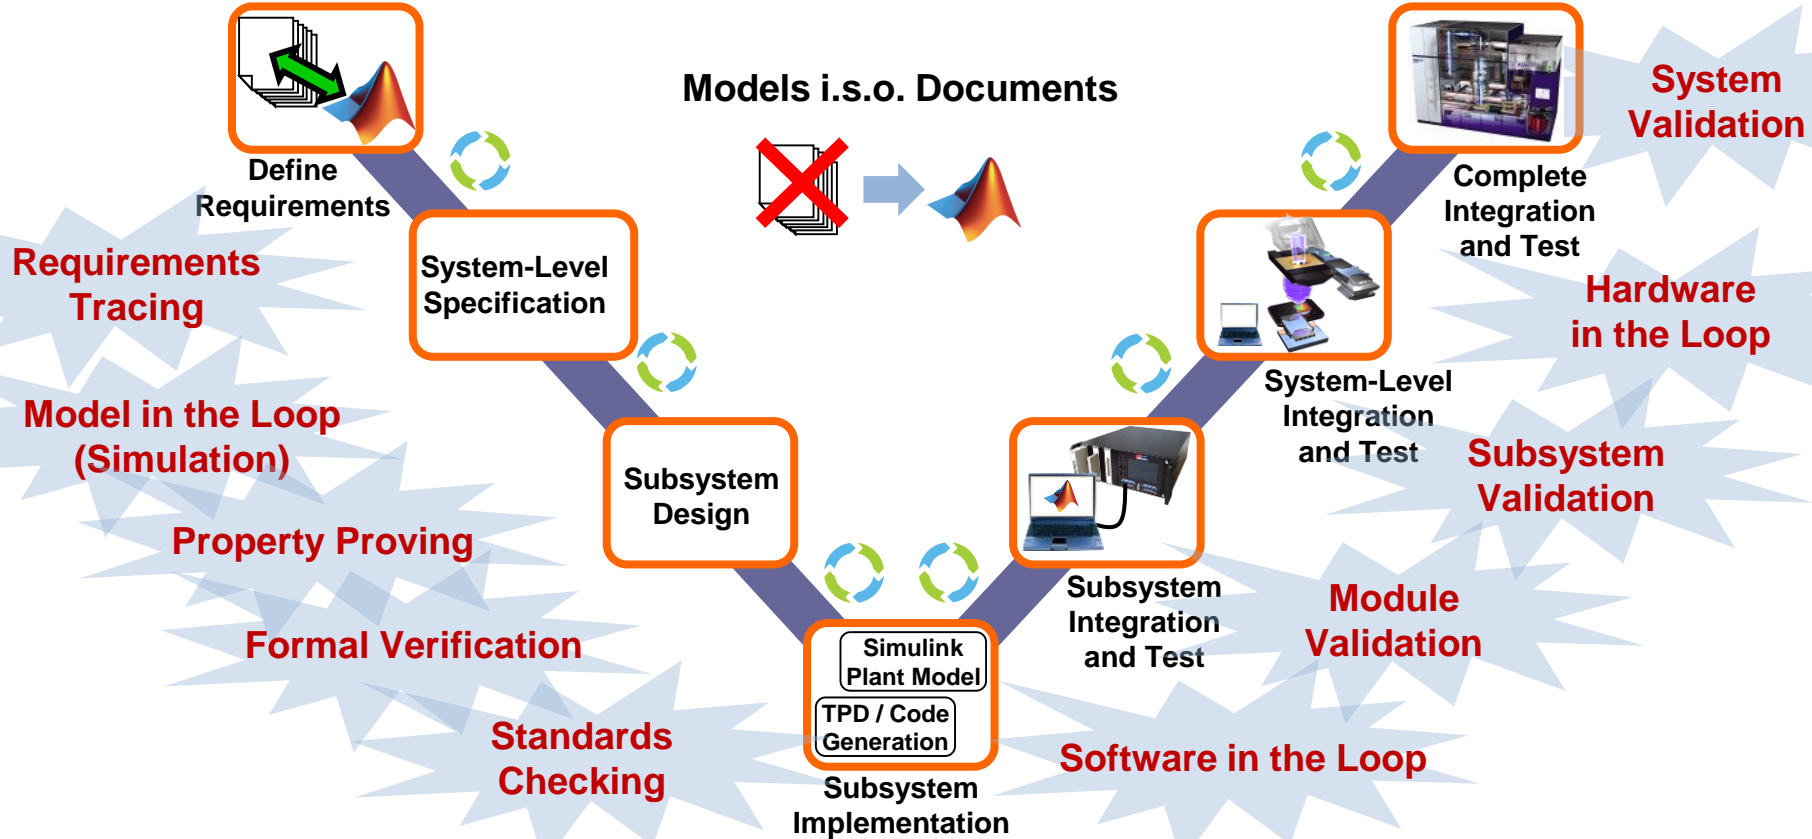

# Different approach needed to reduce development effort

# Model Driven Engineering vision

Models i.s.o. Documents

# Summary and conclusions

# Summary and Conclusions

- Moore's Law has shaped the world as we know it
- Lithography has enabled and driven Moore's Law
  
- "Moore's law for product development" is not sustainable
- To continue driving Moore's law, the R&D way of working needs to evolve towards a system-wide model driven engineering approach
- Directions pursued are: higher abstraction levels, executable specifications (models instead of documents), formal model verification and design time validation, automatic code generation
  
- Further elaboration of industry standards is desirable to easily connect solutions across the development chain
- Strategic partnerships, such as between ASML and MathWorks, are instrumental to achieve this

The image features the ASML logo in a bold, dark blue font on the left side. The background is a light blue gradient with abstract, flowing white and light blue wave-like patterns that sweep across the frame from the bottom left towards the top right. The overall aesthetic is clean, modern, and professional.

**ASML**
